#### Epidemiology

<b>Epidemiological comments</b>
1. Regarding the source of outbreak and traceability, the origin of infected pigs has been traced in the outbreak site (Wuwu community). The pigs came from two privately owned farms, belonging to the same owner. The farms have been destocked and pig house emptied. The environmental samples were tested positive for African swine fever (ASF) nucleic acid. A total of 676 live pigs were stamped out in the periphery of the two pig farms.
2. Local veterinary authorities and institutions have conducted emergency screening investigation in the whole province, up to August 14. A total of 35.54 million live pigs had been screened; 10,226 samples were collected and 7 samples were tested positive for ASF nucleic acid. The epidemiological survey showed that the positive samples came from the two villages in the threatened area, and all of the live pigs in the two villages were stamped out.
<b>Source of the outbreak(s) or origin of infection</b>
• Unknown or inconclusive
